Amalgam toxicity

Dear comission,

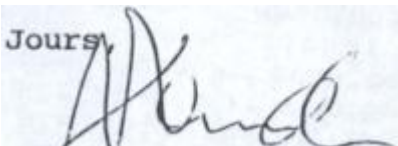

you are going to decide about the toxicity of amalgam in teeth.

We reported on 20 000 patients after exact mercury tests before and after removing of amalgam toothfillings. The Symptoms of amalgam intoxication decreased in nearly all cases significantly after removing. There were some letal cases before treatment was begun.

As surplus diagnostic means we included SPECT, MR, LTT, identification of metal components of amalgam in tumors of all kinds (which was found in high amounts) and others.

Amalgam as toothfiling should immediatly be banned worldwide.

Your experts may any time go through the files. A summary of our results can be read in my 2 volume "Handbuch der Amalgamvergiftung" M. Dauderer- ecomed Verlag, Landsberg.,
